Problem Statement

Banks and financial institutions receive a large number of credit card applications every day. Evaluating each application manually is time-consuming, costly, and may lead to inconsistent decisions due to human error. The approval process requires analyzing several factors, such as the applicant's income, employment status, credit history, family status, and financial background.

The objective of this project is to develop a machine learning-based Credit Card Approval Prediction System that can automatically predict whether a credit card application is likely to be approved or rejected based on historical applicant data. The system aims to assist banks in making faster, more accurate, and consistent approval decisions while reducing manual effort and improving customer service.
